

## Summary

The invention concerns a device for the transdermal delivery of a compound of the  
5 Formula I

Formula I

10 in which A means hydrogen or deuterium, R stands for a group that is selected from C<sub>1-6</sub>-alkyl, C<sub>3-10</sub>-cycloalkyl or phenyl, which may each be substituted with C<sub>1-3</sub>-alkoxy, fluorine, chlorine, bromine, iodine, nitro, amino, hydroxyl, oxo, mercapto or deuterium and where the C-atom marked with a star "\*" is present in the (R)-configuration,

15 characterized by the fact that the compound of the general Formula I is present in a polymer matrix and is released through the human skin in a dose of 0.5-20 mg per day.

20 Furthermore, the invention concerns use of the said compounds of the Formula I for the manufacture of transdermal drugs.
